# How do tidal disruption events shine in optical and radio?

Fangyi (Fitz) Hu Supervisor: Daniel Price, Ilya Mandel Collaborator: Adelle Goodwin, Re'em Sari, Kimitake Hayasaki Monash University 6 Jun 2025 @ 2nd Phantom European workshop

## What is tidal disruption events? A free way to murder stars

- Stars approach supermassive black holes
- Tidal force/ diverging geodesics
- Tidal radius  $r_t$
- Disrupted into a stream
- Fallback to form accretion disk and launch outflows

[Rees 1988]

## Solutions...Really?

- Tidal compression / nozzle shock [Ryu et al. 2023]
- Self-collision [Lu & Bonnerot 2020]
- Reprocessing layer [Loeb & Ulmer 1997] / [Metzgar & Stone 2016]
- Cooling envelope [Metzgar 2022] / [Sarin & Metzgar 2024]
- Stream-disk interaction [Steinberg 2024]

## Hydrodynamics simulations Tidal disruption events

- Phantom General relativistic smoothed particle hydordynamics
- MESA real  $1 M_{\odot}$  solar star
- $10^6 M_{\odot} \, {\rm SMBH}$
- Eccentric e = 0.95, deep encounter  $\beta = r_t/r_p = 5$  orbit

## Hydrodynamics simulations

•

(c) 2023 Fangyi Hu

log column density [g/cm\*]

[Hu *et al.* 2024]

#### Hydrodynamics simulations Tidal

t=0 days

.

#### Hydrodynamics simulations Tidal

0 days

#### Hydrodynamics simulations Outflow interaction with circumnuclear material

9

- Shock amplifies magnetic field
- Free electrons form synchrotron/radio radiations
- Spherically symmetric CNM shell
  - Power law density profile  $\rho \propto r^{-1.7}$  (Cendes *et al.* 2021)
  - $\rho_0 = 5.03 \times 10^{-17}$  g cm<sup>-3</sup>,  $r_0 = 10^{15}$  cm  $\approx 66.8$  au
  - Stationary, cold T = 10 K

#### Hydrodynamics simulations Outflow interaction with circumnuclear material

t=0 days

## **Radio synchrotron shocks Properties**

- Radius, velocity  $\approx$  obs  $\bullet$
- Energy range  $\ll$  obs ullet
- Low CNM density  $\rightarrow$  large initial rad, vel

 $\beta = 1, e = 0.95$ 

 $\beta = 5, e = 0.95$ 

 $\beta = 5, e = 0.95, 1M_{\odot}$ 

-  $\beta = 5, e = 0.95, 10^{-3} M_{\odot}$ 

 $\beta = 3, e = 1$ 

 $\beta = 5, e = 0.95, 0.01 M_{\odot}$ 

 $\beta = 5, e = 1$

## **Ray tracing**

- Post-processing
- Radiative transfer equation
  - $I_{n+1} = I_n e^{-\tau_n} + S_n (1 e^{-\tau_n})$
- Optical
  - $S_{\nu}$  blackbody
  - au electrion scattering
- Radio
  - $S_{\nu}$  slow cooling synchrotron (Sari *et al.* 1998)

1

•  $\tau_{\nu}$  - self-absorption

## **Optical** Lightcurve

$ \begin{array}{c c}  & 100k, \beta = 1 \\  & 100k, \beta = 5 \\  & 1M, \beta = 5 \\  & - 1M, \beta = 5, 0.1\kappa_{es} \\  & \cdots & 1M, \beta = 5, 0.01\kappa_{es} \\  & - 1M, \beta = 5, \kappa_{therm} \\  & 1M, \beta = 5, \theta_{\chi} = 60^{\circ} \end{array} $	$ 1M, β = 5, θ_x = 210^\circ  1M, β = 5, θ_y = 60^\circ  1M, β = 5, θ_y = 210^\circ  10M, β = 5  AT2018lni  AT2019qiz  AT2019lwu$	AT2018lna AT2018hyz AT2019azh AT2018iih AT2019cho AT2018zr	* * * * *	AT2019meg AT2018hco AT2019bhf PS1-10jh ASASSN-14li ASASSN-18jd

## Radio Spectra

![](_page_14_Figure_1.jpeg)

[Hu et al. 2025 submitted]

## **TDE nozzle shock**

- Nozzle shock at pericenter  $\bullet$
- Heat dissipation ullet
- Convergence issue ullet

![](_page_15_Figure_4.jpeg)

## **TDE nozzle shock**

- Adaptive particle refinement
  [Nealon & Price 2025]
- Split particles before second passage of pericenter
- Increase resolution for a convergent result

![](_page_16_Figure_4.jpeg)

![](_page_17_Figure_0.jpeg)

## Conclusions

The models are correct!!

- GR hydro simulations of TDEs and outflow interaction with CNM
- Ray tracing to find spectra/lightcurve
- Results within magnitudes of optical & radio observations despite random parameters/simple setup
- Fangyi (Fitz) Hu, Daniel J. Price, Ilya Mandel, 2024, ApJL, 963, L27
